Multimodal RAG Test Document

Document ID: MRAG-TEST-001

Topic: Renewable Energy Project

The Green Valley Solar Project is a proposed renewable-energy installation in Gujarat, India. The project plans to install 120 solar panels with a combined capacity of 60 kilowatts (kW). Construction is scheduled to begin on 15 September 2026 and is expected to take approximately 45 days.

Project Details

The estimated project cost is ■48 lakh. The project manager is Aisha Mehta, while the electrical engineering lead is Rahul Shah. The main objective is to reduce electricity purchased from the grid and demonstrate the use of solar power for a medium-sized commercial facility.

Performance and Timeline

The system is expected to generate approximately 92,000 kilowatt-hours (kWh) of electricity per year. The project team estimates that the installation could reduce annual carbon dioxide emissions by about 74 metric tonnes. A performance review is planned for 30 November 2026.

Additional Evidence

Budget

The ■48 lakh budget includes solar panels, inverters, mounting equipment, electrical installation, testing, and initial maintenance. A contingency reserve of ■4 lakh is included within the overall budget.

Important Note

The figures in this document are synthetic test data created specifically for testing a multimodal retrieval-augmented generation (RAG) application. They do not describe a real project.

Test Questions

1. What is the planned capacity of the Green Valley Solar Project?

2. When is construction scheduled to begin?

3. Who is the project manager?

4. What is the estimated project cost?

5. How much electricity is the system expected to generate annually?

6. What annual reduction in carbon dioxide emissions is estimated?

7. When is the performance review planned?

8. What does the ■48 lakh budget include?

9. Who is the electrical engineering lead?

10. Is this document describing a real project?
